naturally- occurring pharmacuetically active peptides. These novel peptides specifically bind to undetermined and determined targets in various organs and in lymphocytes. The peptides or an be used in compositions, where they can be linked to pharmaceutical agents, to treat various diseases and conditions. The peptides or chimeric polypeptides comprising these pharmaceutically active peptides and a second peptide may be labelled with a marker (radioactive isotope, etc) to form an interval of the second peptide may be labelled with a marker (radioactive isotope, etc) to form an interval of the second peptide may be labelled with a marker (radioactive isotope, etc) to form an interval of the second peptide may be labelled with a marker (radioactive isotope, etc) to form an interval of the second peptide may be labelled with a marker (radioactive isotope, etc) to form an interval of the second peptide may be labelled with a marker (radioactive isotope, etc) to form an interval of the second peptide may be labelled with a marker (radioactive peptides and a second peptide may be labelled with a marker (radioactive peptides and a second peptide may be labelled with a marker (radioactive peptides and a second peptide may be labelled with a marker (radioactive peptides and a second peptide may be labelled with a marker (radioactive peptides and a second peptide may be labelled with a marker (radioactive peptides and a second peptides and a second peptide may be labelled with a marker (radioactive peptides and a second pept

                                                                                                                                                                                                                        The invention relates to a peptide or polypeptide comprising an FV comblecule, a construct or fragments or a construct of a fragment with cenhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single chain Fv (scFv) or a disulfide Fv (dsFv). The peptide, optionally in association with or attached, coupled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, caute myelond leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region correlated peptide of the invention

                                                                                                   The invention relates to an isolated epitope present on cancer cells and climportant in physiological phenomena such as cell rolling, metastasis and climportant in physiological phenomena such as cell rolling, metastasis and climportant in physiological phenomena such as cell rolling, metastasis and climportant in physiology, in antibody, an antibody, clis antigen-binding fragment or its complex comprising at least one clist antibody or its binding fragment having a first hypervariable region. The clippes are useful for inhibiting cell rolling, inflammation, autoimmune clistopes are useful for inhibiting cell rolling, inflammation, autoimmune clistopes, thrombosis, restenosis, metastasis, growth and/or replication of cumour or leukaemia cells, increase in number of tumour or leukaemia cells in a patient, cell-cell, cell-matrix, platelet-matrix, platelet-cells in a patient, cell-platelet adesion or aggregation, for increasing comerciality of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-cells in a patient, or for decreasing the number of tumour or leukaemia cells in a patient, or for decreasing the number of tumour or leukaemia cells in a patient, or for decreasing the number of tellogeness of tumour or leukaemia cells, for increasing the susceptibility of diseases such as expocardial infarction, treating cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diagnosing and treating cellseases such as myocardial infarction, treating cellseases such as myocardial infarction, autoimmune diseases and other diseases mediated by abnormal platelet cof the invention. This sequence represents a human antibody fragment cells invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; antibody; epitope; cancer; tumour; cell rolling; intiammation; metastasis; hypervariable region; autoimmune disease; thrombosis; restenosis; leukaemia; inflammatory disease; cardiovascular disease; myocardial infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; Page 228; Opp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated epitope present on cancer cells and important physiological phenomena such as cell rolling, metastasis and inflammation, for treating autoimmune, inflammatory or carding

                                                                                                                                                                 determining region 3 (CDR3). The invention relates to compositions utilising an agent and an antibody or its fragment. The agent is a toxin, readiostope or pharmaceutical agent such as doxorubicin. It is complexed or combined with or conjugated to the antibody or its fragment. The antibody may have a first hypervariable region comprising the present and/or antibody can be present in the composition is sequence. The agent and/or antibody can be present in the composition is a sub-clinical amount, i.e. less than the amount generally found to be clinically effective when the agent is administered alone. The composition is used in claimed methods of: inhibiting cell rolling, inflammation, thrombosis, restenosis, metastasis, the growth and/or replication of tumour cells or leukaemia cells, an increase in number of tumour or leukaemia cells or leukaemia cells, an increase in number of platelet-platelet and/or cell-platelet complex formation, aggregation or adhesion, increasing the mortality rate of tumour or leukaemia cells, the susceptibility of tumour or leukaemia cells to damage by anti-cancer agents; and ameliorating the effects of a disease, preventing a disease, treating a disease or inhibiting the progress of a disease.
                                                                                                                                        Sequence 6 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition comprising an agent and/or antibody or its fragment, useful for treating auto-immune disease, thrombosis, restenosis, metastasis, or for inhibiting growth and/or replication of tumor cells or leukemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of a human antibody complementarity determining region 3 (CDR3). The present sequence is that of the heavy chain complementarity determining region 3 (CDR3) of 132 ADJ57363, an scFv antibody fragment that binds P-selectin glycoprotein ligand-1 (PSGL-1). L32 was identified by screening a phage library, which had diversity only in the heavy chain CC receptor was not previously known or characterised. The invention relates to an antibody or its fragment having the binding capabilities of 132 and CC comprising at least one of the heavy chain CDRs of 132. Such antibodies can be used in therapeutic, diagnostic, prognostic and staging methods. CC pharmaceutical compositions comprising such antibodies are used to treat conditions related to: inhibiting or treating cell rolling, inflammation, autoimmune disease, infection (e.g. HIV infection), metastasis, and CC growth and/or replication of tumour cells; increasing the mortality of tumour cells; altering the susceptibility of susceptibility of leukaemia cells altering the susceptibility of leukaemia cells to damage by anti-cancer agents; CC increasing the susceptibility of leukaemia cells in a patient; and decreasing the conduct cells in a patient; and decreasing the conduct cells in a patient; and decreasing the conduct cells using the antibodies. A method of purging tumour cells from a patient involves incubating the cells with the antibody.

                                                                                                                                                                                                                                           밁
                                                                                                                                             8
                                                                                                                                                                                                                                                                   The invention relates to a peptide or polypeptide comprising an Fv conscrue, a construct or fragments or a construct of a fragment with cenhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single chain Fv (scFv) or a disulfide Fv (dsFv). The peptide, optionally in association with or attached, coupled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, coupled, selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, myelond leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region content of the invention

The invention relates to an isolated epitope present on cancer cells and CC important in physiological phenomena such as cell rolling, metastasis and CC inflammation, where the epitope is capable of being bound by an antibody, CC its antigen-binding fragment or its complex comprising at least one CC antibody or its binding fragment or its complex comprising at least one CC antibody or its binding fragment having a first hypervariable region. The CC theory of the binding fragment having a first hypervariable region. The CC theory of the cell-cell, cell-cell rolling, inflammation, autoimmune CC cells in a patient, cell-cell, cell-matrix, platelet-matrix, platelet-CC platelet and/or cell-platelet adhesion or aggregation, for increasing CC mortality of tumour or leukaemia cells, for increasing the susceptibility CC of diseased cells to damage by anti-disease, anti-cancer or anti-CC leukaemia agents, or in the manufacture of a medicament for the above CC mentioned purposes. The epitopse are useful for diagnosing and treating CC diseases such as cancer, leukaemia, autoimmune diseases, inflammatory CC diseases, cardiovascular diseases such as myocardial infarction, CC retinopathic diseases caused by sulphated tyrosine-dependent protein-cr invention and diseases caused by sulphated tyrosine-dependent protein of invention.

                                                                                                                             The invention relates to an isolated epitope present on cancer cells and C important in physiological phenomena such as cell rolling, metastasis and C inflammation, where the epitope is capable of being bound by an antibody, CC its antigen-binding fragment or its complex comprising at least one cepitopes are useful for inhibiting cell rolling, inflammation, autoimmune cdiseases, thrombosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells in a patient, cell-cell, cell-matrix, platelet-matrix, platelet-matrix, platelet-matrix of diseased cells to damage by anti-disease, anti-cancer or anti-cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diagnosing and treating cells in a patient, or in the manufacture of a medicament for the above diseases such as cancer, leukaemia, autoimmune diseases, inflammatory cdiseases such as cancer, leukaemia, autoimmune diseases, inflammatory cfinction and diseases and other diseases mediated by abnormal platelet function and diseases and other diseases mediated by abnormal platelet function interactions.
                                                                  protein interactions. This sequence the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated epitope present on cancer cells and important physiological phenomena such as cell rolling, metastasis and inflammation, for treating autoimmune, inflammatory or cardi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             restenosis; leukaemia; inflammatory disease; myocardial infarction; retinopathic disease; sulphated tyrosine-dependent protein-protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Fig 51;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diseases, and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Lazarovits J, Hagai Y, Szanthon E, Richter T,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               31-DEC-2001; 2001WO-US049442

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated epitope present on cancer cells and climportant in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one antibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune disease, thrombosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, cell-matrix, platelet—anticle platelet and/or cell-platelet adhesion or aggregation, for increasing mortality of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diseases, inflammatory diseases such as carcer, leukaemia, autoimmune diseases, inflammatory cretinonathic, disease, and other diseases such as myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

```
The invention relates to a peptide or polypeptide comprising an Fv CC molecule, a construct or fragments or a construct of a fragment with CC enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single CC chain Fv (scFv) or a disulfide Fv (dsFv). The peptide, optionally in association with or attached, coupled, combined, linked or fused to a cc pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, cu myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an acute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region correlated peptide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated epitope present on cancer cells and CC important in physiological phenomena such as cell rolling, metastasis and crimportant in physiological phenomena such as cell rolling, metastasis and cC inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one can tibody or its binding fragment having a first hypervariable region. The cc antibody or useful for inhibiting cell rolling, inflammation, autoimmune cd disease, thrombosis, restenosis, metastasis, growth and/or replication of ct tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, cell-matrix, platelet-matrix, platelet-cc platelet and/or cell-platelet adhesion or aggregation, for increasing contrality of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-cc leukaemia agents, or for decreasing the number of tumour or leukaemia cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diagnosing and treating contrality of diseases, cardiovascular diseases such as cancer, leukaemia, autoimmune diseases, inflammatory contrality of the cardiovascular diseases such as myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the protein sequence of human scFv fragment Y1. CC This antibody was identified by screening a human antibody phage library CC that has diversity only in the heavy chain CDR3 regions. Fixed human CC platelets were screened in order to identify antibodies that bind CC quantification, a subunit of the CD42 complex. Y1 also binds the CC and 285 on glycocalicin, a subunit of the CD42 complex. Y1 also binds the CC antibing an intibing an agent and an antibody or its fragment. The agent such as a CC compositions utilising an agent and an antibody or its fragment. The agent such as a CC composition. It is complexed or combined with or conjugated to the CC antibody or its fragment. The agent and/or antibody can be present in the composition is a sub-clinical amount, i.e. less than the amount generally found to be clinically effective when the agent is administered alone. CC inflammation, thrombosis, restenosis, metastasis, the growth and/or creplication of tumour cells or leukaemia cells, an increase in number of tumour or leukaemia cells, cell-matrix, platelet—matrix, platelet—matrix of disease cells to damage by anti-cancer agents; and ameliorating the mortality rate of tumour or leukaemia cells to damage by anti-cancer cc agents; and ameliorating the effects of a disease, preventing a disease, treating a disease or inhibiting the progress of a disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       agent is a toxin, radioisotope or pharmaceutical agent such as doxorubicin. It is complexed or combined with or conjugated to the antibody or its fragment. The agent and/or antibody can be present in the composition is a sub-clinical amount, i.e. less than the amount generally found to be clinically effective when the agent is administered alone. The composition is used in claimed methods of: inhibiting cell rolling, inflammation, thrombosis, restenosis, metastasis, the growth and/or replication of tumour cells or leukaemia cells, an increase in number of tumour or leukaemia cells or leukaemia cells, an increase in number of platelet-platelet and/or cell-platelet complex formation, aggregation or adhesion, increasing the mortality rate of tumour or leukaemia cells, the susceptibility of tumour or leukaemia cells to damage by anti-disease gents, and ameliorating the effects of a disease, preventing a disease, treating a disease or inhibiting the progress of a disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

This antibody was identified by screening a human antibody phage library that has diversity only in the heavy chain CDR3 regions. Fixed human platelets were screened in order to identify antibodies that bind platelets. Y17 binds leukaemic cells. The invention relates to

gent and an antibody or its fragment. The agent is a toxin, radioisotope or pharmaceutical agent such as doxorubicin. It is complexed or combined with or conjugated to the antibody or its fragment. The agent and/or antibody can be present in the composition is a sub-clinical amount, i.e. less than the amount generally found to be clinically effective when the agent is administered alone. The composition is used in claimed methods of: inhibiting cell rolling, inflammation, thrombosis, restenosis, cells, an increase in number of tumour or leukaemia cells, cell-cell, cell-matrix, platelet—matrix, platelet—platelet and/or cell-platelet complex formation, aggregation or adhesion; increasing the mortality rate of tumour or leukaemia cells, the susceptibility of disease cells to leukaemia cells to damage by anti-disease gents, and the susceptibility of tumour or leukaemia cells to damage by anti-disease gents, and the susceptibility of tumour or leukaemia cells to damage by anti-disease gents, and the susceptibility of disease cells to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition comprising an agent and/or antibody or its fragment, useful for treating auto-immune disease, thrombosis, restenosis, metastasis, of for inhibiting growth and/or replication of tumor cells or leukemia
                                            effects of a disease, preventing a disease, treating a disease inhibiting the progress of a disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             that has diversity only in the heavy chain CDR3 regions. Leukaemia cells were screened to select specific antibodies that recognise leukaemia cell surface determinants. The invention relates to compositions utilising an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 13;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2004-099189/10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is the protein sequence of human scFv fragment L32.
This antibody was identified by screening a human antibody phage library

    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein search,

Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: MATC J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO F
TITLE REPRENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 23944
LENGTH: 973
TYPE: DPT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ; TYPE: PRT ; ORGANISM: Pseudomonas aeruginosa US-09-252-991A-23944
